- Laws specifically promoting SD are non-existent in BH
- As such, SD and TDR is not a clearly defined component of the education system in BiH.
- There is a need to introduce reform of the BH's legal system in order to promote SD, especially when it comes to TDR
- The education system in BH is highly decentralized and thus fragmented and disharmonized.
- There is a need to provide more regulation from the national level of government
- Higher education institutions do not have a legal obligation to justify effective use of funds, which can negatively affect the quality of education
- The use of funds should be tied and conditioned upon the results ensuing from the TDR
- Investment in R&D is an important element of the modernization of the higher education system of any country. BH and universities alike need to increase investment in research and development in pursuit of the desired level of development.
- These programs should draw on various social and natural science disciplines, including ecological economics, environmental economics, legal science, policy studies, development studies, business and management, geography, sociology, science and technology studies, ecology, environmental science and soil science in our work.
- Education thus needs to be restructured into education for sustainable development and research into TDR that should strive for more than reducing deficiency of knowledge towards including an attitude to act based on the interactive stimuli from the immediate natural and socio-economic environment.
